GPSAdb: a database maintained through repeated data updates

A Update cycle

Repeat searches on instruction; supervise submitted jobs

1 Track new data
Re-run saved GEO / literature queries
Merge and deduplicate

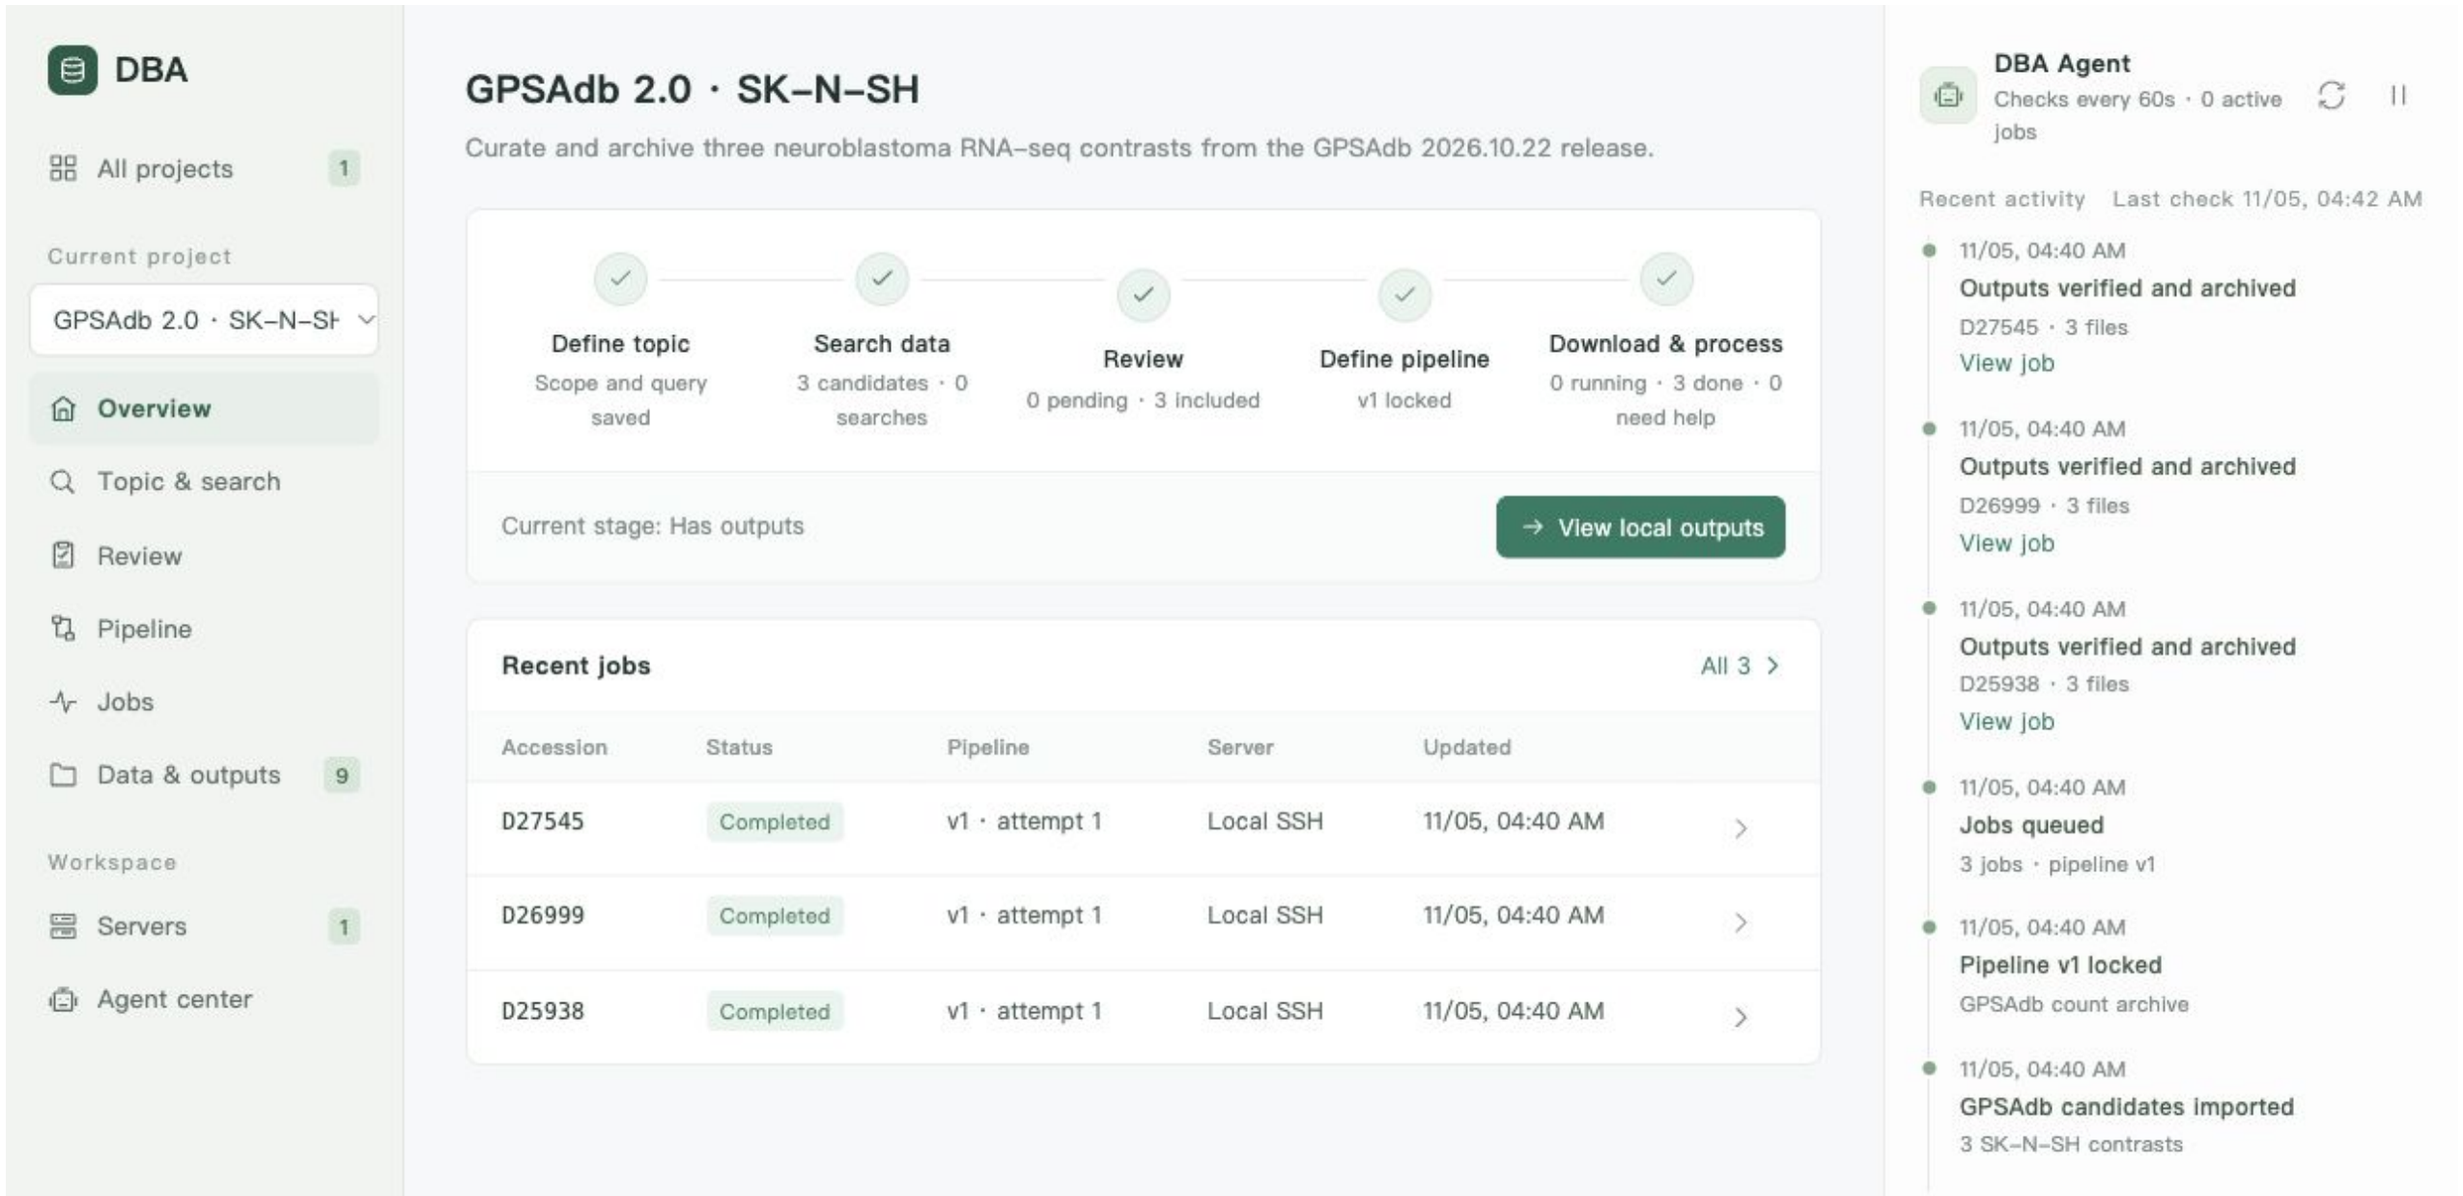

2 Review for GPSAdb
Single-gene perturbation
Matched controls
Record inclusion + groups

3 Process on server
Lock pipeline version
Dispatch jobs over SSH
Monitor; recover with help

4 Update the archive
Verify output checksums
Counts + groups + QC
Keep version and provenance

Next update: new records, prior results retained

B GPSAdb example in DBA: three completed SK-N-SH contrasts

Recorded interface: 3 included contrasts, 3 completed jobs, 9 archived files; Local SSH.
